Algoritmul LeLann

```
chan ch[1:n](token tok, int id_mare);
process Proc[p = 1 to n]{
   typedef SOP{multime identificatori};
   SOP List = {p};
   enum state (candidate, leader, lost);
   state stare = candidate;
   send ch[Urm](tok, p);
   receive ch[p](tok, q);
   while (q <> p) {
       List = List U {q};
       send ch[Urm](tok, q);
       receive ch[p](tok, q);
   }
   if (p == max(List)) stare = leader
   else state = lost
}
```

Număr de mesaje $\Rightarrow O(N^2)$
